

WIPRO @ HSLU

Wipro Work of Jonas & Benj “Smart Meter Into the Cloud”

Usage

As a prerequisite you need to install two things:

- podman: For build, deploy and running
- mkcert: To generate local tls certificates

If you want to use local versions of the containers, you can build them by running:

```
# optional, only needed if the containers shall be built locally  
make docker
```

```
# requires mkcert installation  
make run
```
